## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 8\_Q1

Attempt : 1

Total Mark : 10

Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

Write a program to validate the email address and display suitable exceptions if there is any mistake.

Create 3 custom exception classes as below

DotExceptionAtTheRateExceptionDomainException

A typical email address should have a ". " character, and a "@" character, and also the domain name should be valid. Valid domain names for practice be 'in', 'com', 'net', or 'biz'.

Display Invalid Dot usage, Invalid @ usage, or Invalid Domain message based on email id.

Get the email address from the user, validate the email by checking the

above-mentioned criteria, and print the validity status of the input email address.

***Input Format***

The first line of input contains the email to be validated.

***Output Format***

The output prints a Valid email address or an Invalid email address along with the suitable exception

If email ends with . or contains not exactly one . after @, it throws:

DotException: Invalid Dot usage

Invalid email address

If @ appears not exactly once, it throws:

AtTheRateException: Invalid @ usage

Invalid email address

If the part after the last dot is not among accepted domains:

DomainException: Invalid Domain

Invalid email address

If all conditions satisfied then print:

Valid email address

Refer to the sample input and output for format specifications.

### ***Sample Test Case***

Input: sample@gmail.com

Output: Valid email address

### ***Answer***

```
// You are using Java
import java.util.*;
class DotException extends Exception {
    public DotException(String message) {
        super(message);
    }
}
class AtTheRateException extends Exception {
    public AtTheRateException(String message) {
        super(message);
    }
}
class DomainException extends Exception {
    public DomainException(String message) {
        super(message);
    }
}
public class Main {
    public static void validateEmail(String email) throws DotException,
AtTheRateException, DomainException {
        String[] validDomains = {"in", "com", "net", "biz"};
        if (email.chars().filter(ch -> ch == '@').count() != 1) {
            throw new AtTheRateException("Invalid @ usage");
        }
        if (email.startsWith("@") || email.endsWith("@")) {
            throw new AtTheRateException("Invalid @ usage");
        }
        String[] parts = email.split("@");
        if (parts.length != 2) {
            throw new AtTheRateException("Invalid @ usage");
        }
        String localPart = parts[0];
```

```

String domainPart = parts[1];
if (!domainPart.contains(".")) {
    throw new DotException("Invalid Dot usage");
}
if (email.endsWith(".")) {
    throw new DotException("Invalid Dot usage");
}
if (email.contains(..) || email.contains(@@)) {
    throw new DotException("Invalid Dot usage");
}
String[] domainSplit = domainPart.split("\\.");
String domainExtension = domainSplit[domainSplit.length - 1];
boolean validDomain = false;
for (String d : validDomains) {
    if (domainExtension.equals(d)) {
        validDomain = true;
        break;
    }
}
if (!validDomain) {
    throw new DomainException("Invalid Domain");
}
System.out.println("Valid email address");
}

public static void main(String[] args) {
    Scanner sc = new Scanner(System.in);
    String email = sc.nextLine().trim();

    try {
        validateEmail(email);
    } catch (DotException e) {
        System.out.println("DotException: " + e.getMessage());
        System.out.println("Invalid email address");
    } catch (AtTheRateException e) {
        System.out.println("AtTheRateException: " + e.getMessage());
        System.out.println("Invalid email address");
    } catch (DomainException e) {
        System.out.println("DomainException: " + e.getMessage());
        System.out.println("Invalid email address");
    }
}
}

```

**Status :** Correct
